

Awesome Chocolates Sales Report

So I finally finished my first Power BI project. I used the Awesome Chocolates dataset from that YouTube tutorial . Here's what I found.

The Data

It's shipment data from 2022. Six columns — Sales Person, Country, Product, Date, Amount, and Boxes Shipped. About 1000 rows. Nothing crazy.

Page 1 — Who's buying and what's selling

Boxes by Country

I made a **column chart** showing total boxes shipped per **country**. Australia is at the top with around 32K **boxes**. Then Canada, UK, India, USA, and New Zealand at the bottom with about 26K.

Boxes by Product

Bar chart. 50% Dark Bites is the clear winner. Smooth Silky Salty and Eclairs are right behind. The nut-based stuff — Almond Choco, Choco Coated Almonds — barely moves.

Sum of Boxes Shipped by Product

Page 2 — The money side

Sales by Month

I used a line chart with **Amount** on the **Y axis** and **Date** on the **X axis**. Power BI automatically made a date hierarchy so I could drill down from year to quarter to month.

January was huge — almost 0.9M. Then February dropped hard to 0.70M. March picked up a bit. April was the worst month at 0.67M. Then it climbed back up through May and June (0.87M) before falling again in July and August.

Why did February drop?

Why February was so bad. Instead of doing a whole new analysis, I just right-clicked the February point and hit "Analyze → Explain the decrease."

Power BI did some AI and told me:

- Milk Bars actually went UP by 0.04M
- 85% Dark Bars also went UP by 0.04M
- But Baker's Choco Chips dropped 0.04M
- 99% Dark & Pure dropped 0.05M
- After Nines dropped 0.05M
- Everything else combined dropped 0.14M

So basically a bunch of small drops added up. No single product tanked. Just a bad month overall.

What I learned

- Australia buys the most boxes
- 50% Dark Bites is the best seller
- Nut chocolates don't sell well
- January is the best month, April is the worst
- February's drop wasn't one big problem, just lots of small ones
